CAI6734 Week 9 Individual Progress Report

Testing in Imagination:
World-Model Planning for Language Agents
in Sequential Clinical Diagnosis

Daniel Escalante

Course: CAI6734 (University of Florida)
Advisor: Xuefeng Liu

October 27, 2026

This report covers my individual work for Week 9 (October 21–27, 2026). The main news is that my PhysioNet credential was approved, which clears the blocker from Weeks 6–8. I also set up a shared folder structure for the team's replication of the original paper. I report only verified progress, with no made-up metrics and no PHI.

1 Progress this week

1.1 PhysioNet credentialing: approved

- My PhysioNet account was **credentialed on October 19, 2026** (11:49 PM ET), as shown on my credentialing settings page. The approval followed my October 15 re-submission, which clarified that each collaborator holds their own credentialed access and that no restricted data is shared, and Dr. Liu's response to the supervisor-reference request. This resolves the blocker I reported in Weeks 6–8.

1.2 Dataset access: one more step needed

- When I went to request MIMIC-IV-Ext Clinical Decision Making v1.1 (Hager, Jungmann, Rueckert; physionet.org/content/mimic-iv-ext-cdm/1.1), I found that credentialing alone does not unlock the files. This Credentialed Access project also requires (1) a completed *CITI Data or Specimens Only Research* course, including the HIPAA module, submitted on my PhysioNet Training page with the CITI completion report, and (2) signing the project's data use agreement.
- As of October 27 my Training page shows no training submitted, so I have **not yet** been granted the dataset and have not downloaded any data.

1.3 Replication folder for the team

- I added a `replication-of-original/` folder to `main` (commit `9c1e006`, October 21). Its README sets the rules: each member works only in their own folder; MIMIC data and patient-

level outputs are never committed; and a run counts as reproduced only if its config, seed, upstream commit (`dharouni/LA-CDM` at `3f435a10`), model, hardware, and metrics are logged. It notes the D-5 setup (Nemotron Nano 8B on HiPerGator) and includes a run-log table. There are per-member subfolders (`daniel-escalante/`, `hugo-resendez/`, `edwin-salcedo/`), each with a starter README, plus a `.gitignore` that blocks data files.

1.4 Team coordination and repository state

- On October 20 Hugo Resendez reported that his access was approved on October 19 and asked about the plan. On October 21 I replied, asking whether that was general PhysioNet approval or access to the dataset itself (two separate steps), and asking him to put his replication code in his own folder under `replication-of-original/`. No reply yet.
- `9c1e006` was the only commit this week. There were no commits from Hugo or Edwin and no pull requests or issues. The synthetic CDM environment under `extension/` was unchanged.

2 Setbacks and how I addressed them

- **Credentialing is not the same as dataset access.** I expected approval to let me request the dataset directly, but MIMIC-IV-Ext CDM also requires a submitted CITI training report and a signed DUA. I identified both requirements and made them my immediate next step.
- **No implementation or training progress.** Without the data I did not run S2 `prepare_data`, start HiPerGator jobs, or train any model. I report no experiment numbers.

3 Next steps

1. Upload my CITI completion report to the PhysioNet Training page and, once it is accepted, sign the MIMIC-IV-Ext CDM data use agreement.
2. Download MIMIC-IV-Ext CDM v1.1 to credentialed-access storage (never into the repository), then run LA-CDM data preparation (S2 `prepare_data`) with the config and seed logged.
3. Set up a HiPerGator allocation with Nemotron Nano 8B for the first baseline reproduction, and record runs in the `daniel-escalante/` run log.
4. Follow up with Hugo and Edwin on their dataset access and their replication folders.
5. Continue generating synthetic world-model transition tuples under `extension/`.

Notes

No Table 1 accuracy, F1, or cost figures are reported. They require PhysioNet-authorized data and CUDA runs that have not happened yet.
